

Blooming Days: Skin & Hair Care Tracker is an application that lets allows a user to track their skin and hair care progress. Users will have the ability to enter their current skin/hair care products and categorize them by their targeted use. For example, if someone is using a skin care product, what issue is that product targeting? If the issue acne, users will be able to specify and enter the information into a "Current Cabinet" directory. The app will then prompt the user to enter the date when the product was first used, or default to the current date as well as asking for an optional picture of their current skin. The information will save to the calendar.

Skin and hair care are an important part of one's life. The ability to track progress and improvement (or lack of) will allow users to make more informed decisions on their skin and hair health and the products they use.

Often, when someone begins using a product, that product needs a particular amount of time before you can begin to show results. Creating a tracker will allow users to not only keep track of this time, but look back on the state of their skin/hair so that they are able to more clearly see changes over time.

Bloom is an app looking to become an extension of your skin & hair care routine.

The project will be built using Spring, Java, SQL, DB, Heroku, and an React front end app.
