Blooming Days
SKIN & HAIR CARE TRACKER

Blooming Days: Skin & Hair Care Tracker is an application that lets allows a user to track their skin and hair care progress. Users will have the ability to enter their current skin/hair care products and categorize them by their targeted use. For example, if someone is using a skin care product, what issue is that product targeting? If the issue acne, users will be able to specify and enter the information into a "Current Cabinet" directory. The app will then prompt the user to enter the date when the product was first used, or default to the current date as well as asking for an optional picture of their current skin. The information will save to the calendar.

Skin and hair care are an important part of one's life. The ability to track progress and improvement (or lack of) will allow users to make more informed decisions on their skin and hair health and the products they use.

My MVP will allow users to enter their current products they are using and track their daily routines where they can record current conditions, supplemented w/ a picture if they so desire. The app will also have a product directory they can pull product information from.

Bloom is an app looking to become an extension of your skin & hair care routine.

The project will be built using Spring, Java, SQL, DB, Heroku, and React front end app.
